# Welcome to the Blockchain Internship

Hello welcome to the training on blockchain.

My name is Vasu and I will be your instructor for this course and I'm super excited to welcome you into this training program and the purpose of this first day is to look at the structure of the training course to help you navigate it better for understanding.

So let's have a look at how this training comes together.

Since this is a training and internship we will learn what is blockchain and how to implement it.

First of all in this training we will start off by talking about module one block chain intuition. So Atlanta and the fact that intuition is a very important component of learning complex topics such as block chain and in the intuition you will understand everything that we need to know about the fundamentals of block chain on a very intuitive level so it just makes sense.

And then after the intuition of Module 1 you will have the practical side of module one which is creating a general purpose block chain where make you through step by step of how to program your own blotching.

Later on will be the cryptocurrency intuition where you will found out all of the fundamentals of how cryptocurrency is work and module to be is the crew to currency transactions intuition.

Then again you will have a practical session a practical module.

And next will be to create a smart contract in module 3 in the intuition of smart contracts will talk about what these smart contracts are why they mean the next future for the Internet and how this is all related to block and how it all comes together on block chain.

And once again we will build on the foundational knowledge that we have.

Next step through creating a smart contract and actually launching or imitating an ice CEO to see how those smart contracts can be used in the real world.

We specifically structure the course in the way that you can take the intuition which are highlighted here or the modules that are highlighted here in green were found having to go into the purple modules and still get all of that.

And along with this three modules we will be building some blockchain applications projects and that how you can understand to implement the project on blockchain and few programs and examples of blockchain programming .

And on that note I hope you're super excited about this course as excited as we are.

And let's just straight into it.

"Today is the first day of rest of my life" -Vasu
